

CSE 5345/7345

Assignment 0. (not for submission)

String processing is very important in working with the web. This exercise will give you some experience and practice.

- Download NetBeans
- write -- a **Java method**:

```
public static String addTwoStrings(String s1, String s2)
```

that returns a string value of the sum of two integers passed as parameters.

If one of the parameters is not an integer, return an informative message as the return value.

Run several tests of this function from main. When you feed a non-integer parameter String, your program WILL throw an exception. Read the exception message and determine the name of the exception, then modify your program by adding a try ..catch block. In the catch block, put the name of the type of exception that is thrown.

For example

```
try {  
  
    ... code that may throw exception  
  
}  
  
catch (SomeExceptionType e) {  
  
}
```

Important: Your method should not write or display ANYTHING - any writing or display should occur in main.

Assignment 1 will require such a method deployed as a servlet.
